Unit 1 Project

This project has two parts: a math portion and a language portion. You can work in pairs of two but you must submit your own project with your own work.

60 points

The first portion asks you **to write a program that creates a funny story by asking the user for words**. (20 points)

Example

Enter a name: Sarah

Enter an animal: penguin

Enter a place: Walmart

Enter a food: pizza

Enter an adjective: gigantic

Enter a verb: dance

Enter a number: 47

The program then produces something like:

Sarah went to Walmart with a gigantic penguin.

The penguin ate 47 slices of pizza.

Suddenly, the penguin decided to dance

in the middle of the store!

Sarah couldn't believe what she was seeing.

Required

- At least **7 inputs**
- At least **7 variables**

    - A name
    - An animal
    - A place
    - A food
    - An adjective
    - A verb
    - A number
- At least **5 sentences** in the final story
- Use both strings and numbers
- Print the completed story
- Include comments
- Use concatenation
- Plus 0.5 points if you make me LOL.

The second portion is the math portion, and it is worth 40 points. You will need to write a program where:

The user enters 4 values that correspond to the points (x_2, x_1) and (y_2, y_1).

The program then calculates:

- *Distance between the points*
- *Midpoint between the points*
- *Slope between the points*
- *Equation of the line in point-slope form*

You will need to import the "math" package and use the math.sqrt() function.
