        print("Wear lightweight clothing.")

    ## Recommend whether to bring an umbrella or not
    if raining == "y":
        print("Bring an Umbrella.")
    else:
        print("No Umbrella is required.")
```

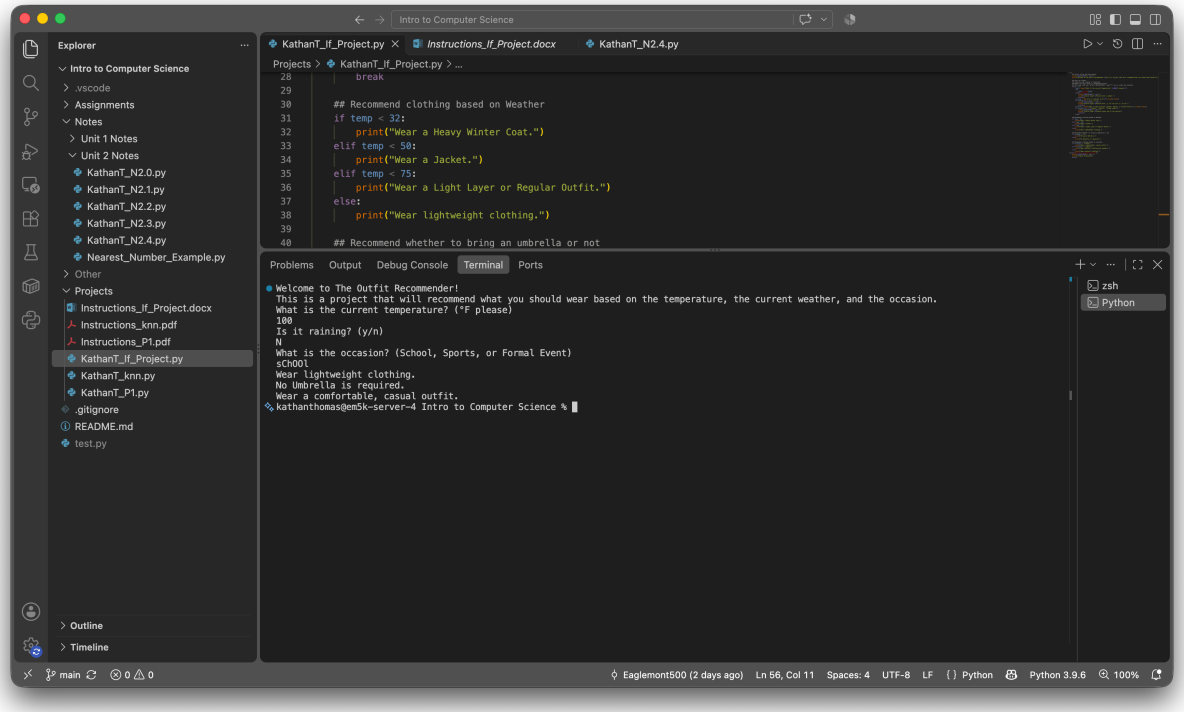

```
    ## Recommend clothing based on occasion
    if occasion == "school":
        print("Wear a comfortable, casual outfit.")
    elif occasion == "sports":
        print("Wear athletic clothing and sneakers.")
    else:
        print("Wear dressier clothing.")
except (EOFError, KeyboardInterrupt):
    print("\033[H\033[J", end="")
    print("Program Terminated")
    exit()
```

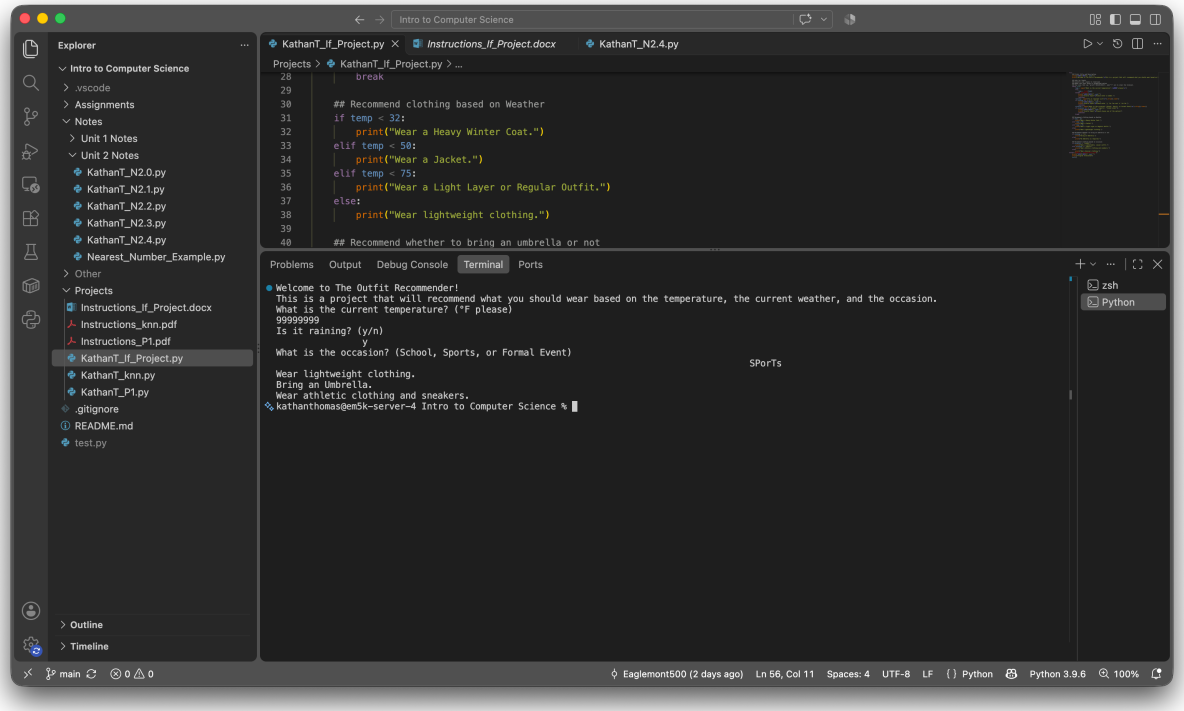

My program first asks you what the temperature is, if it is raining or not, and what the occasion is, while making sure that the user is only able to enter acceptable answers. Next, it uses these user inputs to suggest what you should wear (based on the weather), if you should bring an umbrella or not (based on if it is raining or not), and what kind of clothing you should wear (based on the event you are going to). Finally, my project has proper error handling for the possible errors, and is able to take any sort of possible input (it has .strip() and .lower() for each of the inputs)
